

concurrency model → predicted rerouting win

single event loop sync offload stalls everything	event loop + pool stalls one loop of N	thread / goroutine pool pool overlaps the rest	proxy + agent agent offloads async	process-per-connection OS overlaps connections free
2.4-3.0×	2.7-2.9×	3.0-3.5× (0 async code)	2.1× (C agent)	intra-query pipelining
<i>Redis, Node, Python</i>	<i>nginx, memcached</i>	<i>Apache, Go</i>	<i>HAProxy</i>	<i>Postgres, MariaDB</i>

Win grows with offload weight; it pays only when the offload outweighs per-request CPU.
