

concurrency model → predicted minimal-edit win

single event loop sync offload stalls EVERYTHING	event loop + pool stalls one loop of N	thread / coroutine pool pool overlaps the rest	proxy + agent agent offloads async	process-per-connection OS overlaps connections free
dramatic (offload-bound)	large 3.8-5.2×	automatic (0 async code)	native (config only)	intra-query pipelining

Redis, Python *nginx, memcached* *Apache, Go* *HAProxy, Envoy* *Postgres, MariaDB*

Win grows with offload weight; it pays only when the offload outweighs per-request CPU.
